Even more info

- MPI standard :
<http://www mpi-forum org/docs/docs.html>
- MPI Forum : <http://www mpi-forum org/>
- Implementations: [Open MPI](#), [MPICH](#),
[MVAPICH](#), [Intel MPI](#), [Microsoft MPI](#), and
others

Why MPI is important ?

- **Standardization** - MPI is the only message passing library which can be considered a standard. It is supported on virtually all HPC platforms. Practically, it has replaced all previous message passing libraries
- **Portability** - There is no need to modify your source code when you port your application to a different platform that supports (and is compliant with) the MPI standard
- **Performance Opportunities** - Vendor implementations should be able to exploit native hardware features to optimize performance
- **Functionality** – Rich set of features
- **Availability** - A variety of implementations are available, both vendor and public domain

Before you start

- Compiling and linking MPI application is as simple as calling mpicc, mpicxx and mpifort
 - Your MPI library must be configured with options similar to your applications (-i8)
- Executing MPI application is slightly more complicated
 - mpiexec –np 8 my_awesome_app
 - For more advanced usages carefully read the “mpiexec –help” and/or the online resources

MPI Initialization/Finalization

Innovative Computing Laboratory
COMPUTER SCIENCE DEPARTMENT
UNIVERSITY OF TENNESSEE

Setting up your world

- MPI can be used between `MPI_Init` and `MPI_Finalize`
 - Predefined communication contexts exists after `MPI_Init`
 - `MPI_COMM_WORLD`: all processes created by the same `mpiexec` command
 - `MPI_COMM_SELF`: you are the only participant
 - These predefined objects lose their validity after `MPI_Finalize` (as everything else related to MPI)

```
int MPI_Init(int *argc, char ***argv)
int MPI_Finalize( void )
int MPI_Initialized(int* flag)
int MPI_Finalized(int* flag)
```

Threading support

- Request a certain level of thread support
 - There is a certain cost involved

MPI_THREAD_SINGLE	Only the thread executes in the context of the process (the process should not be multi-threaded)
MPI_THREAD_FUNNELED	Only the thread that called MPI_Init_thread can make MPI calls (the process can be multi-threaded)
MPI_THREAD_SERIALIZED	Only one thread at the time will make MPI calls (the process can be multi-threaded)
MPI_THREAD_MULTIPLE	All threads are allowed to make MPI calls simultaneously (the process can be multi-threaded)

```
int MPI_Init_thread(int *argc, char ***argv,  
                    int required, int* provided)
```

Hello World !

```
int main(int argc, char** argv) {  
    int world_size, world_rank, name_len;  
    char processor_name[MPI_MAX_PROCESSOR_NAME];  
  
    MPI_Init(NULL, NULL);  
    MPI_Comm_size(MPI_COMM_WORLD, &world_size);  
    MPI_Comm_rank(MPI_COMM_WORLD, &world_rank);  
    MPI_Get_processor_name(processor_name, &name_len);  
  
    printf("Hello world from %s, rank %d/%d\n",  
          processor_name, world_rank, world_size);  
  
    MPI_Finalize();  
}
```

MPI Point-to-point communications

Innovative Computing Laboratory
COMPUTER SCIENCE DEPARTMENT
UNIVERSITY OF TENNESSEE

Send & Receive

- Explicit communications (FIFO per peer per communicator)
- Move data from one process to another (possibly local) process
 - The **data** is described by a data-type, a count and a memory location
 - The **destination** process by a rank in a communicator
 - The **matching** is tag based

```
int MPI_Send( void* buf, int count, MPI_Datatype datatype,  
              int dest, int tag, MPI_Comm comm)  
  
int MPI_Recv( void* buf, int count, MPI_Datatype datatype,  
              int source, int tag, MPI_Comm comm,  
              MPI_Status* status)
```

Blocking Communications

- The process is blocked in the MPI function until:
 - For receives the remote data has been safely copied into the receive buffer
 - For sends the send buffer can be safely modified by the user without impacting the message transfer

```
int MPI_Send( void* buf, int count, MPI_Datatype datatype,  
              int dest, int tag, MPI_Comm comm)  
  
int MPI_Recv( void* buf, int count, MPI_Datatype datatype,  
              int source, int tag, MPI_Comm comm,  
              MPI_Status* status)
```

Communication modes

- a send in **Standard** mode can be started whether or not a matching receive has been posted. It may complete before a matching receive is posted.
 - successful completion of the send operation may depend on the occurrence of a matching receive
- **Buffered** mode send operation can be started whether or not a matching receive has been posted. It may complete before a matching receive is posted.
 - its completion does not depend on the occurrence of a matching receive
- send that uses the **Synchronous** mode can be started whether or not a matching receive was posted. It will complete successfully only if a matching receive is posted, and the receive operation has started to receive the message
 - Its completion does not only indicates that the send buffer can be reused, but it also indicates that the receiver started executing the matching receive

Communication modes

- send that uses the **Ready** communication mode may be started only if the matching receive is already posted. Otherwise, the operation is erroneous and its outcome is undefined.
 - completion of the send operation does not depend on the status of a matching receive, and merely indicates that the send buffer can be reused

	Buffered	Synchronous	Ready
Send	MPI_Bsend	MPI_Ssend	MPI_Rsend

Semantics of Point-to-Point Communication

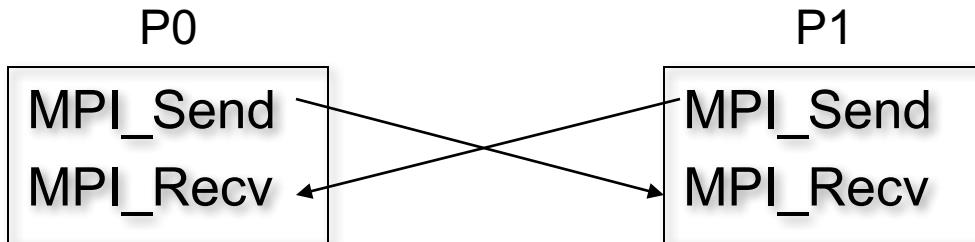

- Order: Messages are non-overtaking
- Progress: No progression guarantees except when in MPI calls
- Fairness: no guarantee of fairness.
However, usually a best effort approach implemented in the MPI libraries.
- Resource limitations: Best effort

Quality implementation: a particular implementation of the standard, exhibiting a set of desired properties.

Don't do !

`MPI_Send(buf, count, datatype, peer, tag, comm)`

`MPI_Recv(buf, count, datatype, peer, tag, comm, &status)`

Non-Blocking Communications

- The process returns from the call as soon as possible, before any data transfer has been initiated.
- All flavors of communication modes supported.
- Subsequent MPI call required to check the completion status.

```
int MPI_Isend( void* buf, int count, MPI_Datatype datatype,  
                int dest, int tag, MPI_Comm comm,  
                MPI_Request *request )  
  
int MPI_Irecv( void* buf, int count, MPI_Datatype datatype,  
                int source, int tag, MPI_Comm comm,  
                MPI_Request *request )
```

Communication Completion

- Single completion
 - completion of a send operation indicates that the sender is now free to update the locations in the send buffer
 - completion of a receive operation indicates that the receive buffer contains the received message

```
int MPI_Wait( MPI_Request *request, MPI_Status *status )
int MPI_Test( MPI_Request *request,
              int *flag, MPI_Status *status)
```

Communication Completion

- Multiple Completions (ANY)
 - A call to `MPI_WAITANY` or `MPI_TESTANY` can be used to wait for the completion of one out of several operations.

```
int MPI_Waitany( int count, MPI_Request *array_of_requests,  
                  int *index, MPI_Status *status )  
int MPI_Testany( int count, MPI_Request *array_of_requests,  
                  int *index, int *flag, MPI_Status *status )
```

Communication Completion

- Multiple Completions (SOME)
 - A call to `MPI_WAIT SOME` or `MPI_TEST SOME` can be used to wait for the completion of at least one out of several operations.

```
int MPI_Waitsome( int incount, MPI_Request *array_of_requests,  
                  int *outcount, int *array_of_indices,  
                  MPI_Status *array_of_statuses )  
int MPI_Testsome( int incount, MPI_Request *array_of_requests,  
                  int *outcount, int *array_of_indices,  
                  MPI_Status *array_of_statuses )
```

Communication Completion

- Multiple Completions (ALL)
 - A call to `MPI_WAITALL` or `MPI_TESTALL` can be used to wait for the completion of all operations.

```
int MPI_Waitall( int count, MPI_Request *array_of_requests,  
                  MPI_Status *array_of_statuses )  
int MPI_Testall( int count, MPI_Request *array_of_requests,  
                  int *flag, MPI_Status *array_of_statuses )
```

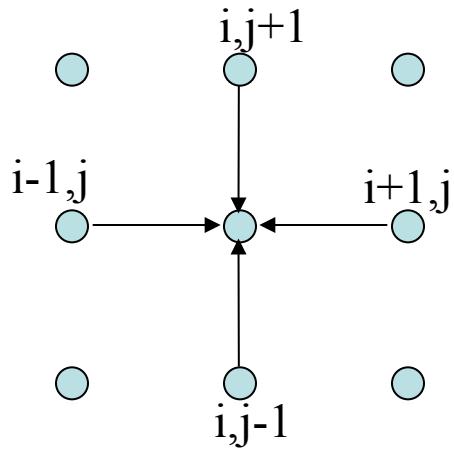

Persistent Communications

- A communication with the same argument list repeatedly executed within the inner loop of a parallel computation
 - Allow MPI implementations to optimize the data transfers
- All communication modes (buffered, synchronous and ready) can be applied

```
int MPI_[B,S,R]Send_init( void* buf, int count, MPI_Datatype datatype,  
                           int dest, int tag, MPI_Comm comm,  
                           MPI_Request *request )  
  
int MPI_Recv_init( void* buf, int count, MPI_Datatype datatype,  
                   int source, int tag, MPI_Comm comm,  
                   MPI_Request *request )  
  
int MPI_Start( MPI_Request *request )  
  
int MPI_Startall( int count, MPI_Request *array_of_requests )
```

$$U_{i,j}^{n+1} = \frac{1}{4} \left(U_{i-1,j}^n + U_{i+1,j}^n + U_{i,j-1}^n + U_{i,j+1}^n \right)$$

Laplace's equation – MPI

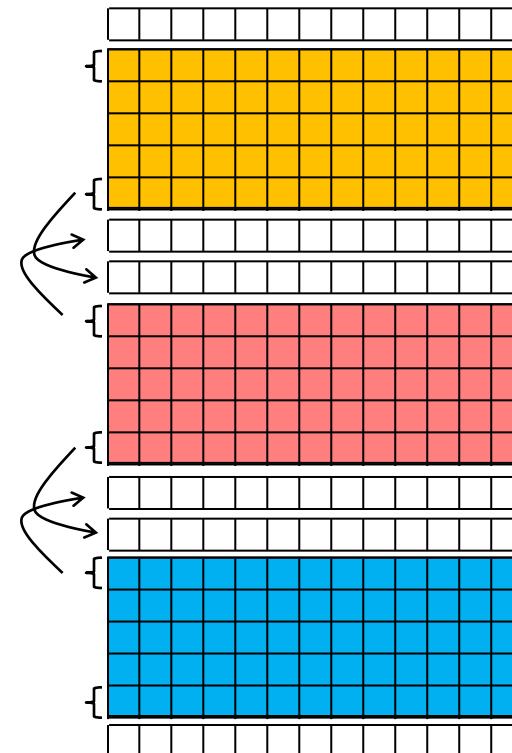

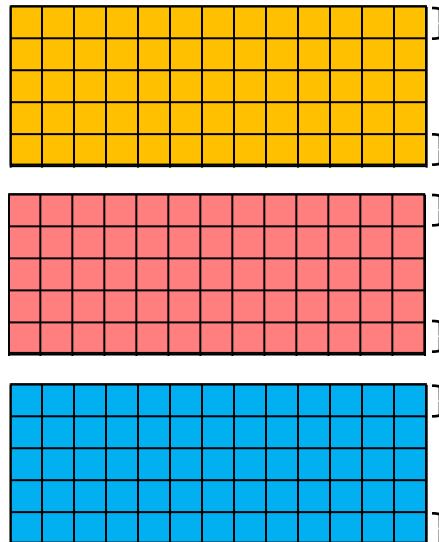

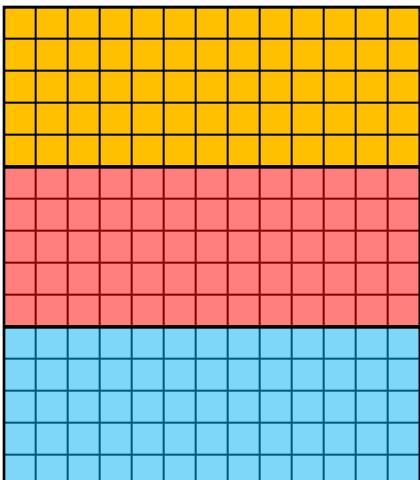

for $j = 1$ to $jmax$

for $i = 1$ to $imax$

$$\text{Unew}(i,j) = 0.25 * (U(i-1,j) + U(i+1,j) \\ + U(i,j-1) + U(i,j+1))$$

end for
end for

MPI Derived Datatypes

Innovative Computing Laboratory
COMPUTER SCIENCE DEPARTMENT
UNIVERSITY OF TENNESSEE

MPI Datatypes

- Abstract representation of underlying data
 - Handle type: MPI_Datatype
- Pre-defined handles for intrinsic types
 - E.g., C: MPI_INT, MPI_FLOAT, MPI_DOUBLE
 - E.g., Fortran: MPI_INTEGER, MPI_REAL
 - E.g., C++: MPI::BOOL
- User-defined datatypes
 - E.g., arbitrary / user-defined C structs

MPI Data Representation

- Multi platform interoperability
- Multi languages interoperability
 - Is MPI_INT the same as MPI_INTEGER?
 - How about MPI_INTEGER[1,2,4,8]?
- Handling datatypes in Fortran with
MPI_SIZEOF and
MPI_TYPE_MATCH_SIZE

Multi-Platform Interoperability

- Different data representations
 - Length 32 vs. 64 bits
 - Endianness conflict
- Problems
 - No standard about the data length in the programming languages (C/C++)
 - No standard floating point data representation
 - IEEE Standard 754 Floating Point Numbers
 - Subnormals, infinities, NaNs ...
 - Same representation but different lengths

How About Performance?

- Old way
 - Manually copy the data in a user pre-allocated buffer, or
 - Manually use MPI_PACK and MPI_UNPACK
- New way
 - Trust the [modern] MPI library
 - High performance MPI datatypes

MPI Datatypes

- MPI uses “datatypes” to:
 - Efficiently represent and transfer data
 - Minimize memory usage
- Even between heterogeneous systems
 - Used in most communication functions
(`MPI_SEND`, `MPI_RECV`, etc.)
 - And file operations
- MPI contains a large number of pre-defined datatypes

Some of MPI's Pre-Defined Datatypes

MPI_Datatype	C datatype	Fortran datatype
MPI_CHAR	signed char	CHARACTER
MPI_SHORT	signed short int	INTEGER*2
MPI_INT	signed int	INTEGER
MPI_LONG	signed long int	
MPI_UNSIGNED_CHAR	unsigned char	
MPI_UNSIGNED_SHORT	unsigned short	
MPI_UNSIGNED	unsigned int	
MPI_UNSIGNED_LONG	unsigned long int	
MPI_FLOAT	float	REAL
MPI_DOUBLE	double	DOUBLE PRECISION
MPI_LONG_DOUBLE	long double	DOUBLE PRECISION*8

Datatype Matching

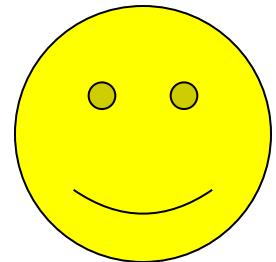

- Two requirements for correctness:
 - Type of each data in the send / recv buffer matches the corresponding type specified in the sending / receiving operation
 - Type specified by the sending operation has to match the type specified for receiving operation
- Issues:
 - Matching of type of the host language
 - Match of types at sender and receiver

Datatype Conversion

- “Data sent = data received”
 - 2 types of conversions:
 - Representation conversion: change the binary representation (e.g., hex floating point to IEEE floating point)
 - **Type conversion**: convert from different types (e.g., int to float)
- Only representation conversion is allowed

Datatype Conversion

```
if( my_rank == root )
    MPI_Send( ai, 1, MPI_INT, ... )
else
    MPI_Recv( ai, 1, MPI_INT, ... )
```

```
if( my_rank == root )
    MPI_Send( ai, 1, MPI_INT, ... )
else
    MPI_Recv( af, 1, MPI_FLOAT, ... )
```

Memory Layout

- How to describe a memory layout ?

```
struct {  
    char c1;           [blue square]  
    int i;            [grey 4x square]  
    char c2;           [green square]  
    double d;          [red 8x square]  
}
```

Memory layout ?

Real memory layout

Using iovcs (list of addresses)

<pointer to memory, length>

<baseaddr c1, 1>, <addr_of_i, 4>,
<addr_of_c2, 1>, <addr_of_d, 8>

- Waste of space
- Not portable ...

Using displacements from base addr

<displacement, length>

<0, 1>, <4, 4>, <8, 1>, <12, 8>

- Sometimes more space efficient
- And nearly portable
- What are we missing ?

Datatype Specifications

- Type signature
 - Used for message matching
 $\{ \text{type}_0, \text{type}_1, \dots, \text{type}_n \}$
- Type map
 - Used for local operations
 $\{ (\text{type}_0, \text{disp}_0), (\text{type}_1, \text{disp}_1), \dots, (\text{type}_n, \text{disp}_n) \}$

→ It's all about the memory layout

User-Defined Datatypes

- Applications can define unique datatypes
 - Composition of other datatypes
 - MPI functions provided for common patterns
 - Contiguous
 - Vector
 - Indexed
 - ...
- ➔ Always reduces to a type map of pre-defined datatypes

Handling datatypes

- MPI impose that all datatypes used in communications or file operations should be committed.
 - Allow MPI libraries to optimize the data representation

`MPI_Type_commit(MPI_Datatype*)`

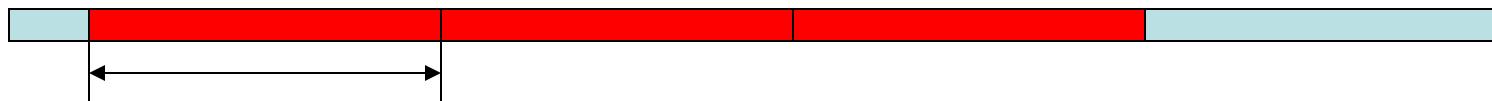

`MPI_Type_free(MPI_Datatype*)`

- All datatypes used during intermediary steps, and never used to communicate does not need to be committed.

Contiguous Blocks

- Replication of the datatype into contiguous locations.

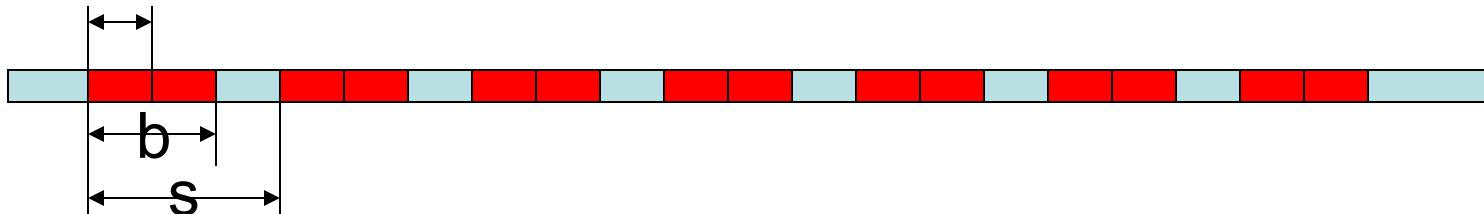

`MPI_Type_contiguous(3, oldtype, newtype)`

```
MPI_TYPE_CONTIGUOUS( count, oldtype, newtype )
  IN    count      replication count( positive integer)
  IN    oldtype    old datatype (MPI_Datatype handle)
  OUT   newtype   new datatype (MPI_Datatype handle)
```

Vectors

- Replication of a datatype into locations that consist of equally spaced blocks
`MPI_Type_vector(7, 2, 3, oldtype, newtype)`

```
MPI_TYPE_VECTOR( count, blocklength, stride, oldtype, newtype )
```

IN	count	number of blocks (positive integer)
IN	blocklength	number of elements in each block (positive integer)
IN	stride	number of elements between start of each block (integer)
IN	oldtype	old datatype (MPI_Datatype handle)
OUT	newtype	new datatype (MPI_Datatype handle)

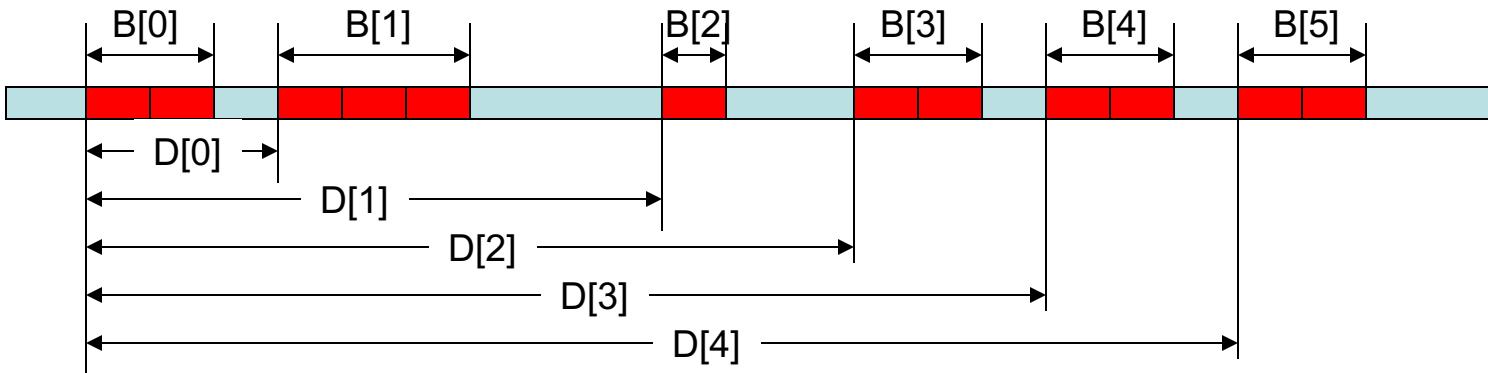

Indexed Blocks

- Replication of an old datatype into a sequence of blocks, where each block can contain a different number of copies and have a different displacement

```
MPI_TYPE_INDEXED( count, array_of_blocks, array_of_displs, oldtype, newtype )
IN  count          number of blocks (positive integer)
IN  a_of_b         number of elements per block (array of positive integer)
IN  a_of_d         displacement of each block from the beginning in multiple multiple
                  of oldtype (array of integers)
IN  oldtype        old datatype (MPI_Datatype handle)
OUT newtype        new datatype (MPI_Datatype handle)
```

Indexed Blocks

```
array_of_blocklengths[] = { 2, 3, 1, 2, 2, 2 }
array_of_displs[] = { 0, 3, 10, 13, 16, 19 }
MPI_Type_indexed( 6, array_of_blocklengths,
                   array_of_displs, oldtype, newtype )
```

Datatype Composition

- Each of the previous functions are the super set of the previous
CONTIGUOUS < VECTOR < INDEXED
- Extend the description of the datatype by allowing more complex memory layout
 - Not all data structures fit in common patterns
 - Not all data structures can be described as compositions of others

“H” Functions

- Displacement is not in multiple of another datatype
- Instead, displacement is in bytes
 - `MPI_TYPE_HVECTOR`
 - `MPI_TYPE_HINDEX`
- Otherwise, similar to their non-”H” counterparts

Arbitrary Structures

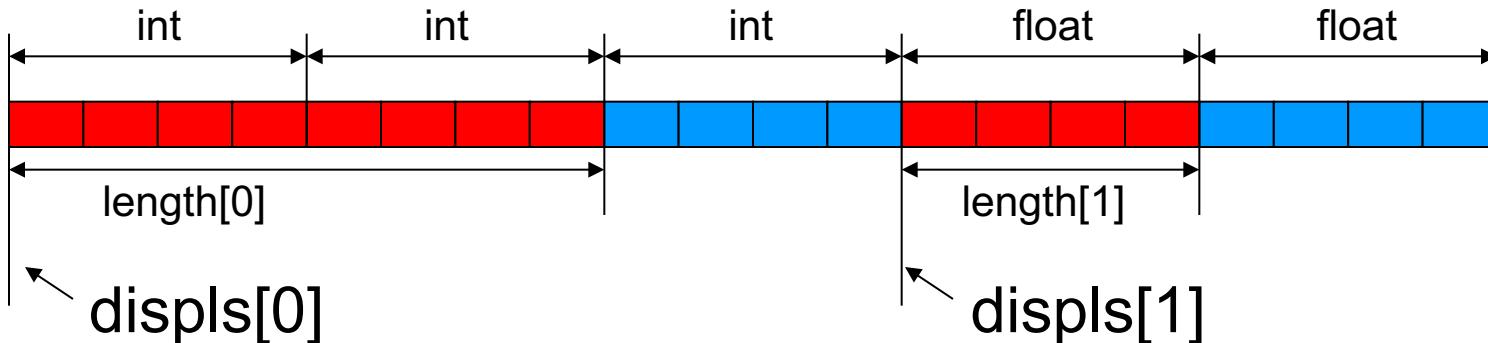

- The most general datatype constructor
- Allows each block to consist of replication of different datatypes

```
MPI_TYPE_CREATE_STRUCT( count, array_of_blocklength,  
                        array_of_displs, array_of_types, newtype )
```

IN	count	number of entries in each array (positive integer)
IN	a_of_b	number of elements in each block (array of integers)
IN	a_of_d	byte displacement in each block (array of Aint)
IN	a_of_t	type of elements in each block (array of MPI_Datatype handle)
OUT	newtype	new datatype (MPI_Datatype handle)

Arbitrary Structures

```
struct {  
    int i[3];           Array_of_lengths[] = { 2, 1 };  
    float f[2];         Array_of_displs[] = { 0, 3*sizeof(int) };  
} array[100];      Array_of_types[] = { MPI_INT, MPI_FLOAT };  
MPI_Type_struct( 2, array_of_lengths,  
                  array_of_displs, array_of_types, newtype );
```

Portable Vs. non portable

- The portability refer to the architecture boundaries
- Non portable datatype constructors:
 - All constructors using byte displacements
 - All constructors with `H<type>`,
`MPI_Type_struct`
- Limitations for non portable datatypes
 - One sided operations
 - Parallel I/O operations

MPI_GET_ADDRESS

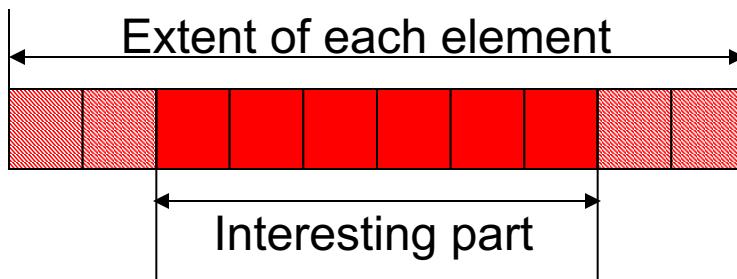

- Allow all languages to compute displacements
 - Necessary in Fortran
 - *Usually* unnecessary in C (e.g., “&foo”)

`MPI_GET_ADDRESS(location, address)`

IN	location	location in the caller memory (choice)
OUT	address	address of location (address integer)

And Now the Dark Side...

- Sometimes more complex memory layout have to be expressed

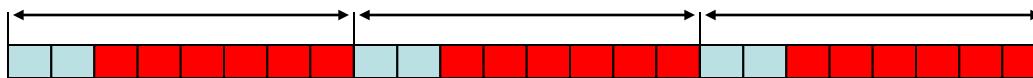

ddt

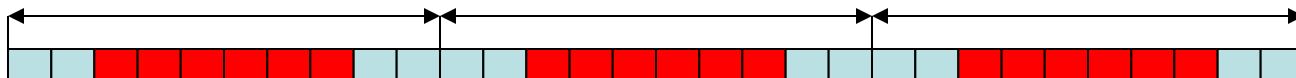

```
Struct {  
    int gap[2];  
    int i[6];  
    int gap2[2];  
}
```

`MPI_Send(buf, 3, ddt, ...)`

What we just did ...

And what we expected to do...

Lower-Bound and Upper-Bound Markers

- Define datatypes with “holes” at the beginning or end
- 2 pseudo-types: `MPI_LB` and `MPI_UB`
 - Used with `MPI_TYPE_STRUCT`

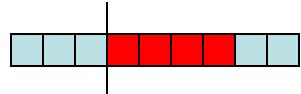

$\text{Typemap} = \{ (\text{type}_0, \text{disp}_0), \dots, (\text{type}_n, \text{disp}_n) \}$

$$\text{lb}(\text{Typemap}) \begin{cases} \text{Min}_j \text{ disp}_j & \text{if no entry has type lb} \\ \min_j \{\text{disp}_j \text{ such that } \text{type}_j = \text{lb}\} & \text{otherwise} \end{cases}$$

$$\text{ub}(\text{Typemap}) \begin{cases} \text{Max}_j \text{ disp}_j + \text{sizeof}(\text{type}_j) + \text{align} & \text{if no entry has type ub} \\ \text{Max}_j \{\text{disp}_j \text{ such that } \text{type}_j = \text{ub}\} & \text{otherwise} \end{cases}$$

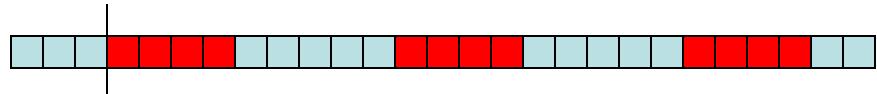

MPI_LB and MPI_UB

```
displs = ( -3, 0, 6 )
blocklengths = ( 1, 1, 1 )
types = ( MPI_LB, MPI_INT, MPI_UB )
MPI_Type_struct( 3, displs, blocklengths,
    types, type1 )
```

Typemap= { (lb, -3), (int, 0), (ub, 6) }

```
MPI_Type_contiguous( 3, type1, type2 )
```

Typemap= { (lb, -3), (int, 0), (int, 9), (int, 18), (ub, 24) }

MPI 2 Solution

- Problem with the way MPI-1 treats this problem: upper and lower bound can become messy, if you have derived datatype consisting of derived datatype consisting of derived datatype consisting of... and each of them has `MPI_UB` and `MPI_LB` set
- There is no way to erase LB and UB markers once they are set !!!
- MPI-2 solution: reset the extent of the datatype

```
MPI_Type_create_resized ( MPI_Datatype datatype,  
MPI_Aint lb, MPI_Aint extent, MPI_Datatype*newtype );
```

- Erases all previous lb und ub markers

True Lower-Bound and True Upper-Bound Markers

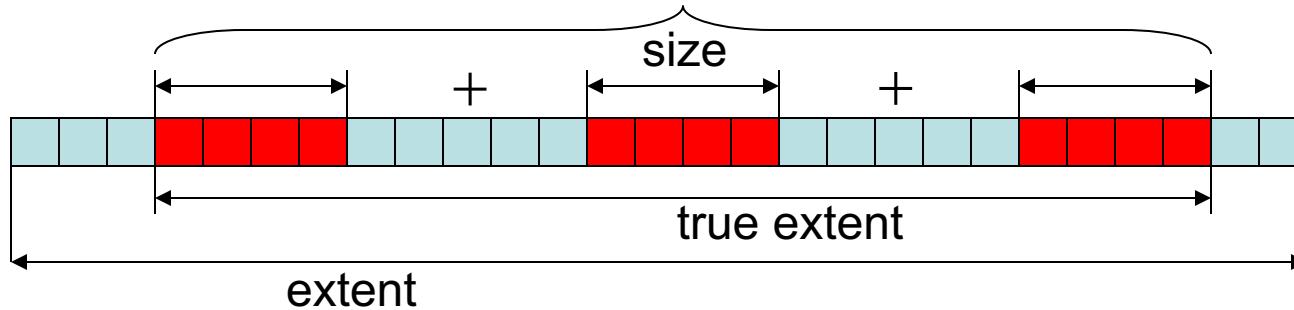

- Define the real extent of the datatype: the amount of memory needed to copy the datatype inside
- **TRUE_LB** define the lower-bound ignoring all the **MPI_LB** markers.

Typemap = { (type₀, disp₀), ..., (type_n, disp_n) }

$$\text{true_lb}(\text{Typemap}) = \min_j \{ \text{disp}_j : \text{type}_j \neq \text{lb} \}$$

$$\text{true_ub}(\text{Typemap}) = \max_j \{ \text{disp}_j + \text{sizeof}(\text{type}_j) : \text{type}_j \neq \text{ub} \}$$

Information About Datatypes

```
MPI_TYPE_GET_{TRUE}_EXTENT( datatype, {true_}lb, {true_}extent )
```

IN datatype the datatype (MPI_Datatype handle)

OUT {true_}lb {true} lower-bound of datatype (MPI_AINT)

OUT {true_}extent {true} extent of datatype (MPI_AINT)

```
MPI_TYPE_SIZE( datatype, size )
```

IN datatype the datatype (MPI_Datatype handle)

OUT size datatype size (integer)

Decoding a datatype

- Sometimes is important to know how a datatype was created (eg. Libraries developers)
- Given a datatype can I determine how it was created ?
- Given a datatype can I determine what memory layout it describe ?

MPI_Type_get_envelope

```
+ MPI_Type_get_envelope ( MPI_Datatype datatype,  
                           int *num_integers, int *num_addresses,  
                           int *num_datatypes, int *combiner );
```

- The combiner field returns how the datatype was created, e.g.
 - MPI_COMBINER_NAMED: basic datatype
 - MPI_COMBINER_CONTIGUOUS: MPI_Type_contiguous
 - MPI_COMBINER_VECTOR: MPI_Type_vector
 - MPI_COMBINER_INDEXED: MPI_Type_indexed
 - MPI_COMBINER_STRUCT: MPI_Type_struct
- The other fields indicate how large the integer-array, the datatype-array, and the address-array has to be for the following call to MPI_Type_get_contents

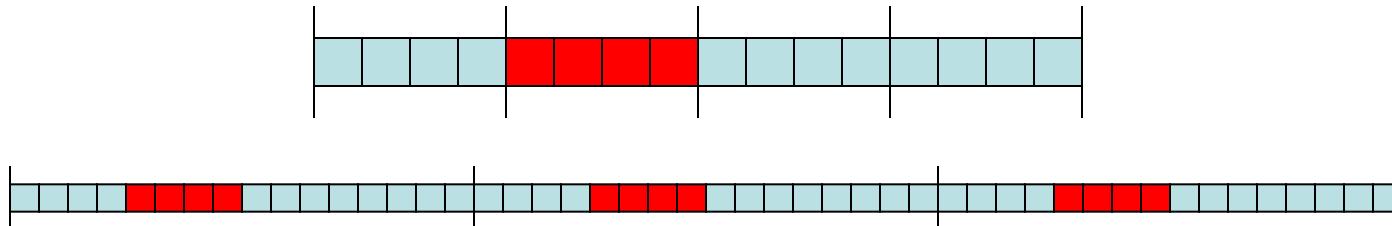

MPI_Type_get_contents

```
+ MPI_Type_get_contents ( MPI_Datatype datatype,  
    int max_integer, int max_addresses, int max_datatypes,  
    int *integers, int *addresses, MPI_Datatype *dts);
```

- Call is erroneous for a predefined datatypes
- If returned data types are derived datatypes, then objects are duplicates of the original derived datatypes. User has to free them using `MPI_Type_free`
- The values in the integers, addresses and datatype arrays are depending on the original datatype constructor

One Data By Cache Line

- Imagine the following architecture:
 - Integer size is 4 bytes
 - Cache line is 16 bytes
- We want to create a datatype containing the second integer from each cache line, repeated three times

- How many ways are there?

Solution 1

```
MPI_Datatype array_of_types[] = { MPI_INT, MPI_INT, MPI_INT, MPI_UB };
MPI_Aint start, array_of_displs[] = { 0, 0, 0, 0 };
int array_of_lengths[] = { 1, 1, 1, 1 };
struct one_by_cacheline c[4];

MPI_Get_address( &c[0], &(start) );
MPI_Get_address( &c[0].int[1], &(array_of_displs[0]) );
MPI_Get_address( &c[1].int[1], &(array_of_displs[1]) );
MPI_Get_address( &c[2].int[1], &(array_of_displs[2]) );
MPI_Get_address( &c[3], &(array_of_displs[3]) );

for( i = 0; i < 4; i++ ) Array_of_displs[i] -= start;

MPI_Type_create_struct( 4, array_of_lengths,
                        array_of_displs, array_of_types, newtype )
```

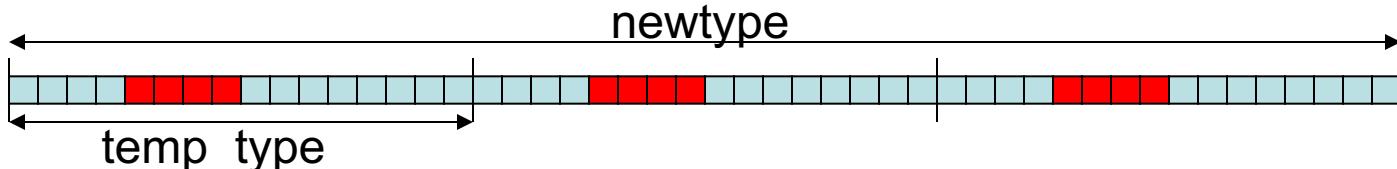

Solution 2

```
MPI_Datatype array_of_types[] = { MPI_INT, MPI_UB };
MPI_Aint start, array_of_displs[] = { 4, 16 };
int array_of_lengths[] = { 1, 1 };
struct one_by_cacheline c[2];

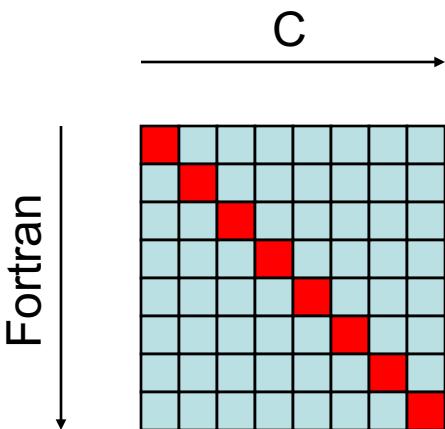

MPI_Get_address( &c[0], &(start) );
MPI_Get_address( &c[0].int[1], &(array_of_displs[0]) );
MPI_Get_address( &c[1], &(array_of_displs[1]) );

Array_of_displs[0] -= start;
Array_of_displs[1] -= start;
MPI_Type_create_struct( 2, array_of_lengths,
                       array_of_displs, array_of_types, temp_type )
MPI_Type_contiguous( 3, temp_type, newtype )
```

Exercise

- Goals:
 - Create a datatype describing a matrix diagonal
 - What's different between C and Fortran ?

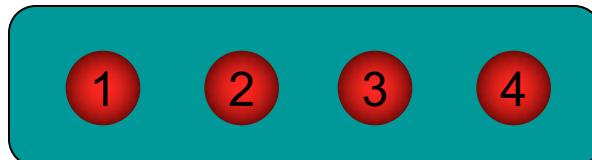

Intra and Inter Communicators

Innovative Computing Laboratory
COMPUTER SCIENCE DEPARTMENT
UNIVERSITY OF TENNESSEE

Groups

- A group is a set of processes
 - The group have a size
 - And each process have a rank
- Creating a group is a local operation
- Why we need groups
 - To make a clear distinction between processes
 - To allow communications in-between subsets of processes
 - To create intra and inter communicators ...

Groups

- **MPI_GROUP_***(group1, group2, newgroup)
 - Where * ∈ {UNION, INTERSECTION, DIFFERENCE}
 - Newgroup contain the processes satisfying the * operation ordered first depending on the order in group1 and then depending on the order in group2.
 - In the newgroup each process could be present only one time.
- There is a special group without any processes **MPI_GROUP_EMPTY**.

Groups

- group1 = {a, b, c, d, e}
- group2 = {e, f, g, b, a}
- Union
 - newgroup = {a, b, c, d, e, f, g}
- Difference
 - newgroup = {c, d}
- Intersection
 - newgroup = {a, b, e}

Groups

- `MPI_GROUP_*`(group, n, ranks, newgroup)
 - Where * ∈ {INCL, EXCL}
 - N is the number of valid indexes in the ranks array.
- For INCL the order in the result group depend on the ranks order
- For EXCL the order in the result group depend on the original order

Groups

- Group = {a, b, c, d, e, f, g, h, i, j}
- N = 4, ranks = {3, 4, 1, 5}
- INCL
 - Newgroup = {c, d, a, e}
- EXCL
 - Newgroup = {b, c, f, g, h, i, j}

Groups

- `MPI_GROUP_RANGE_*`(group, n, ranges, newgroup)
 - Where * ∈ {INCL, EXCL}
 - N is the number of valid entries in the ranges array
 - Ranges is a tuple (start, end, stride)
- For INCL the order in the new group depend on the order in ranges
- For EXCL the order in the new group depend on the original order

Groups

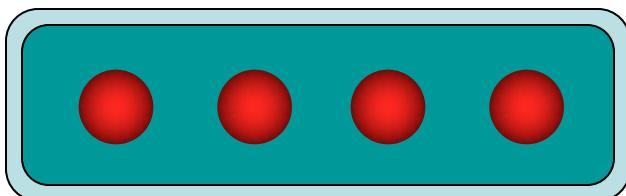

- Group = {a, b, c, d, e, f, g, h, i, j}
- N=3; ranges = ((6, 7, 1), (1, 6, 2), (0, 9, 4))
- Then the range
 - (6, 7, 1) => {g, h} (ranks (6, 7))
 - (1, 6, 2) => {b, d, f} (ranks (1, 3, 5))
 - (0, 9, 4) => {a, e, i} (ranks (0, 4, 8))
- INCL
 - Newgroup = {g, h, b, d, f, a, e, i}
- EXCL
 - Newgroup = {c, j}

Communicators

- A special channel between some processes used to exchange messages.
- Operations creating the communicators are collectives, but accessing the communicator information is a local operation.
- Special communicators: MPI_COMM_WORLD, MPI_COMM_NULL, MPI_COMM_SELF
- **MPI_COMM_DUP(comm, newcomm)** create an identical copy of the comm in newcomm.
 - Allow exchanging messages between the same set of nodes using identical tags (useful for developing libraries).

Intracomunicators

- What exactly is a intracomunicator ?

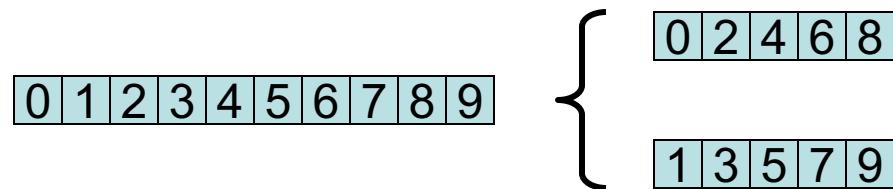

- some processes
- **ONE** group
- one communicator

- `MPI_COMM_SIZE`, `MPI_COMM_RANK`
- `MPI_COMM_COMPARE(comm1, comm2, result)`
 - `MPI_IDENT`: comm1 and comm2 represent the same communicator
 - `MPI_CONGRUENT`: same processes, same ranks
 - `MPI_SIMILAR`: same processes, different ranks
 - `MPI_UNEQUAL`: otherwise

Intracommunicators

- **MPI_COMM_CREATE(comm, group, newcomm)**
 - Create a new communicator on all processes from the communicator comm who are defined on the group.
 - All others processes get MPI_COMM_NULL

```
MPI_Group_range_excl( group, 1, (0, 9, 2), odd_group );
MPI_Group_range_excl( group, 1, (1, 9, 2), even_group );
MPI_Comm_create( comm, odd_group, odd_comm );
MPI_Comm_create( comm, even_group, even_comm );
```

Intracomunicators

- MPI_COMM_SPLIT(comm, color, key, newcomm)
 - Color : control of subset assignment
 - Key : control of rank assignement

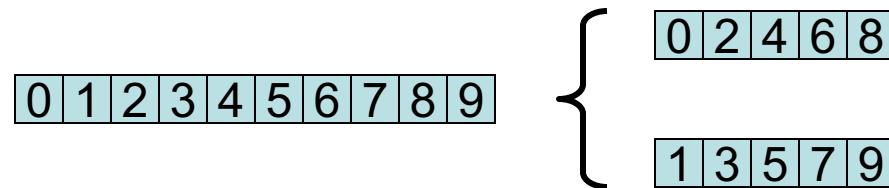

rank	0	1	2	3	4	5	6	7	8	9
process	A	B	C	D	E	F	G	H	I	J
color	0	⊥	3	0	3	0	0	5	3	⊥
key	3	1	2	5	1	1	1	2	1	0

3 different colors => 3 communicators

1. {A, D, F, G} with ranks {3, 5, 1, 1} => {F, G, A, D}
2. {C, E, I} with ranks {2, 1, 3} => {E, I, C}
3. {H} with ranks {1} => {H}

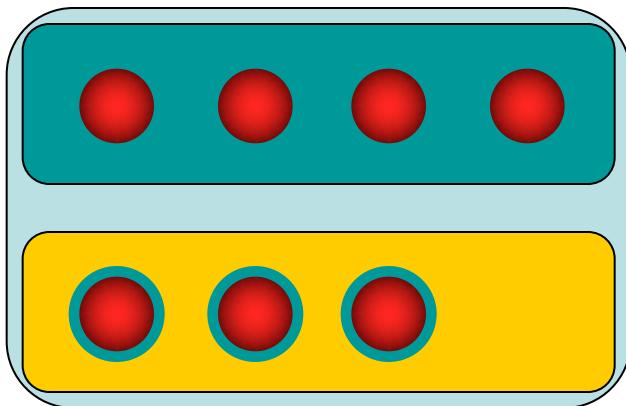

B and J get MPI_COMM_NULL as they provide an undefined color (MPI_UNDEFINED)

Intracommunicators

Intercommunicators

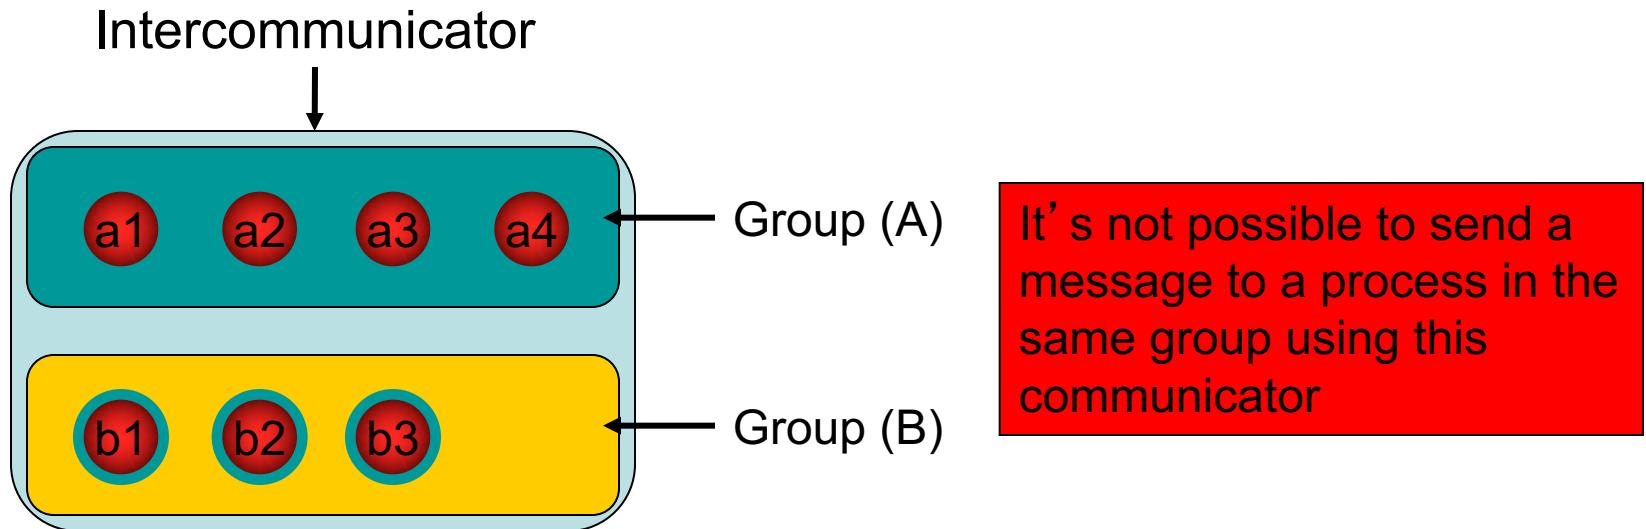

- And what's a intercommunicator ?

- some more processes
- **TWO** groups
- one communicator

- `MPI_COMM_REMOTE_SIZE(comm, size)`
`MPI_COMM_REMOTE_GROUP(comm, group)`
- `MPI_COMM_TEST_INTER(comm, flag)`
- `MPI_COMM_SIZE`, `MPI_COMM_RANK` return the local size respectively rank

Anatomy of a Intercommunicator

For any processes from group (A)

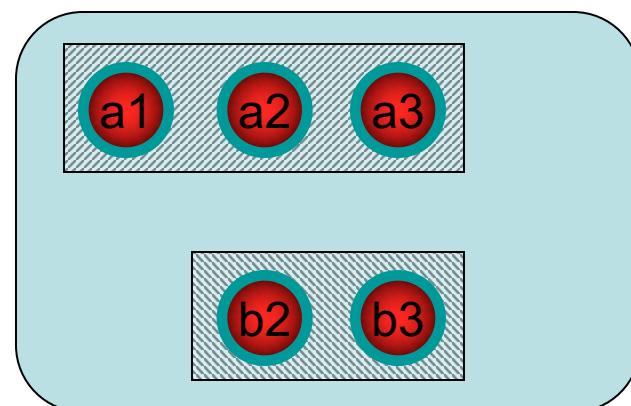

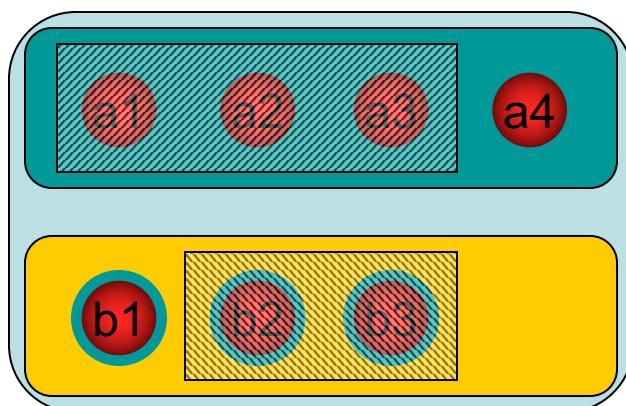

- (A) is the **local** group
- (B) is the **remote** group

For any processes from group (B)

- (A) is the **remote** group
- (B) is the **local** group

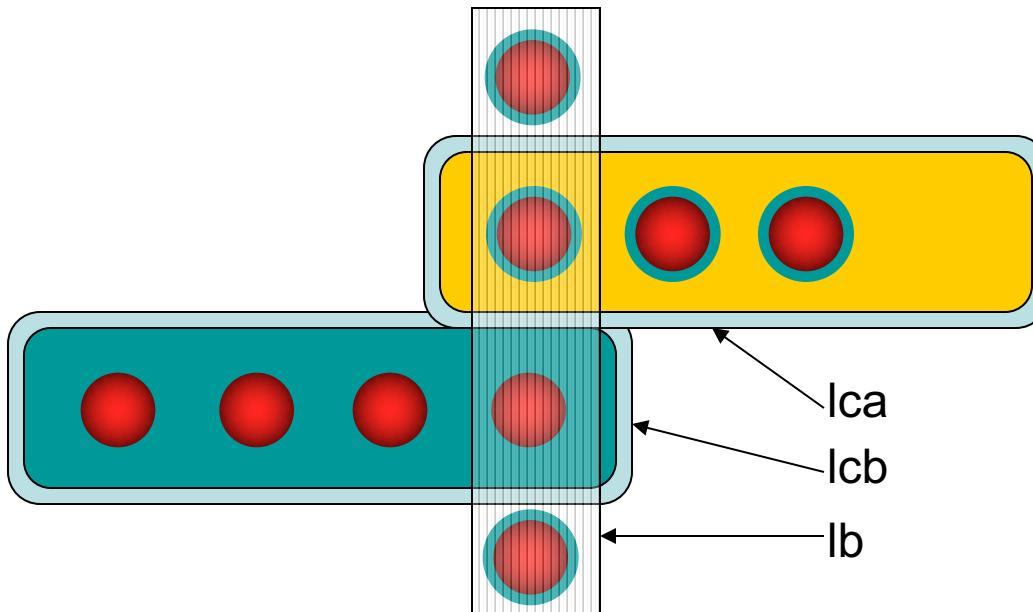

Intercommunicators

- MPI_COMM_CREATE(comm, group, newcomm)
 - All processes on the left group should execute the call with the same subgroup of processes, when all processes from the right side should execute the call with the same subgroup of processes. Each of the subgroup is related to a different side.

Intercommunicators

- `MPI_INTERCOMM_CREATE(local_comm, local_leader, bridge_comm, remote_leader, tag, newintercomm)`
Local_comm : local intracommunicator
Local_leader : rank of root in the local_comm
Bridge_comm : “bridge” communicator ...
Remote_leader : rank of remote leader in bridge_comm

`MPI_INTERCOMM_CREATE`

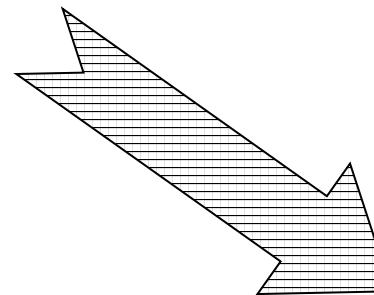

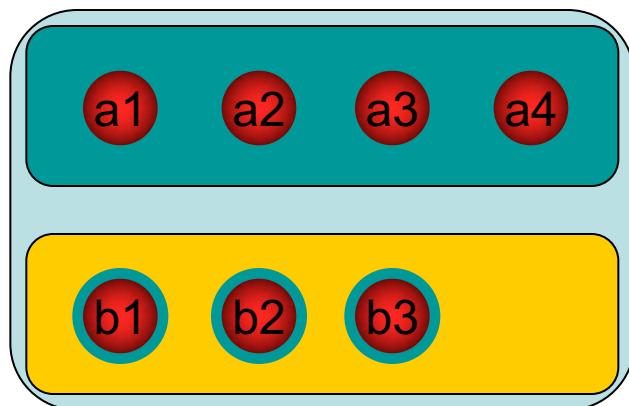

`lca, 0, lb, 2, tag, new`

`lcb, 4, lb, 1, tag, new`

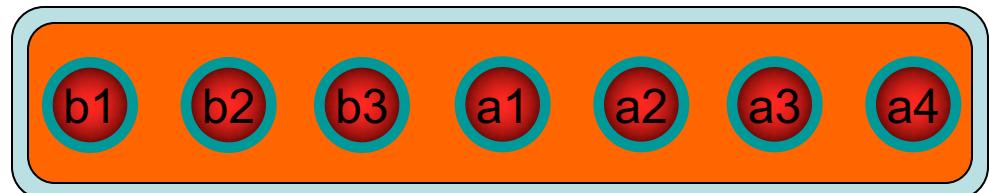

Intercommunicators

- `MPI_INTERCOMM_MERGE(intercomm, high, intracomm)`
 - Create an intracomm from the union of the two groups
 - The order of processes in the union respect the original one
 - The high argument is used to decide which group will be first (rank 0)

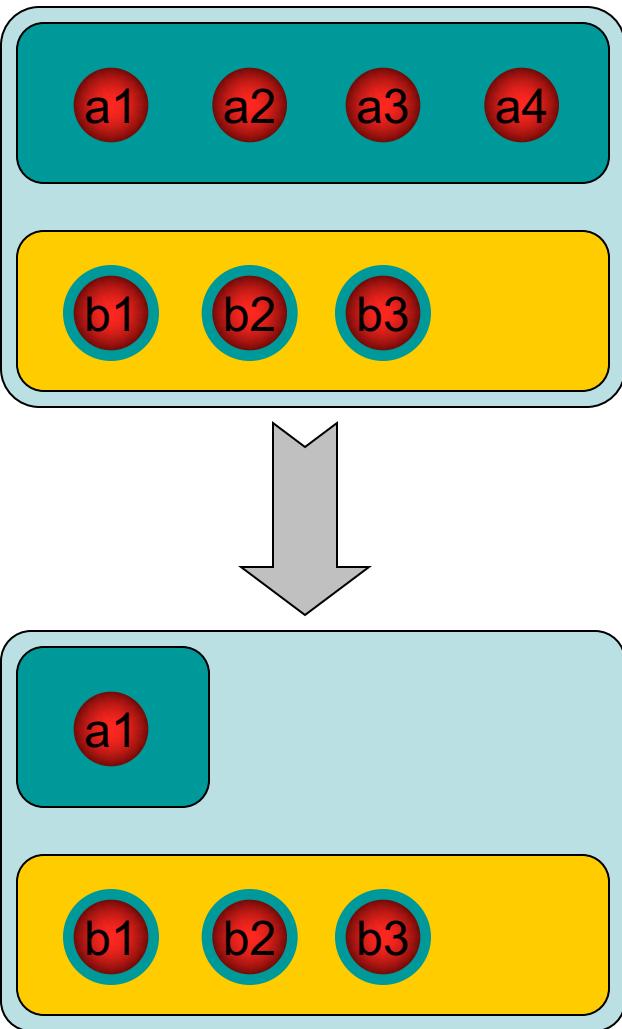

high = false

high = true

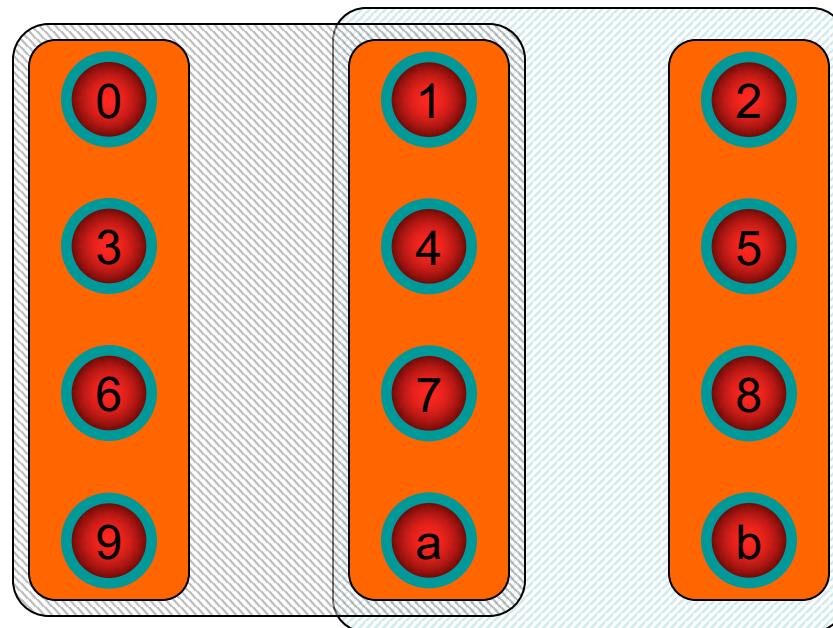

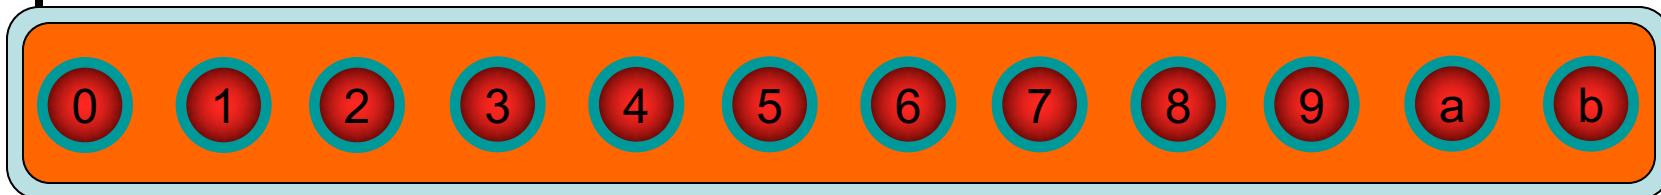

Example

```
MPI_Comm inter_comm, new_inter_comm;  
MPI_Group local_group, group;  
int rank = 0;  
  
if( /* left side (ie. a*) */ ) {  
    MPI_Comm_group( inter_comm, &local_group );  
    MPI_Group_incl( local_group, 1, &rank, &group );  
    MPI_Group_free( &local_group );  
} else  
    MPI_Comm_group( inter_comm, &group );  
  
MPI_Comm_create( inter_comm, group,  
                 &new_inter_comm );  
MPI_Group_free( &group );
```

Exercice

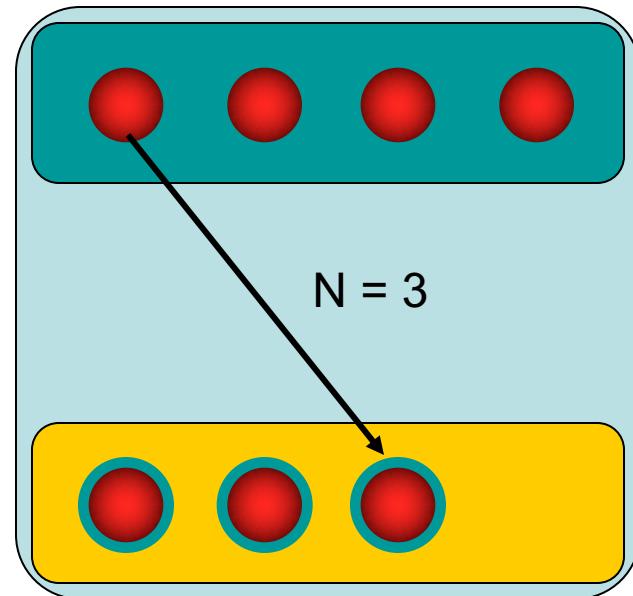

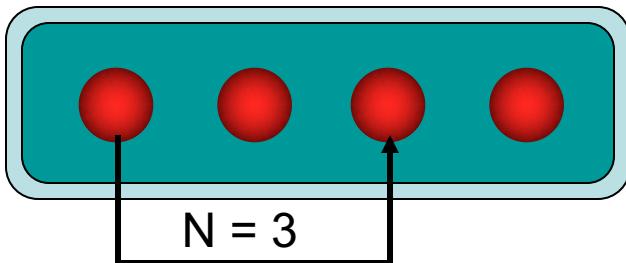

Intercommunicators – P2P

On process 0:

```
MPI_Send( buf, MPI_INT, 1, n, tag, intercomm )
```

- Intracommunicator
- Intercommunicator

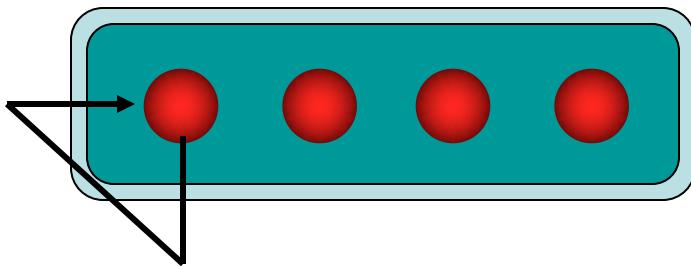

Intercommunicators – P2P

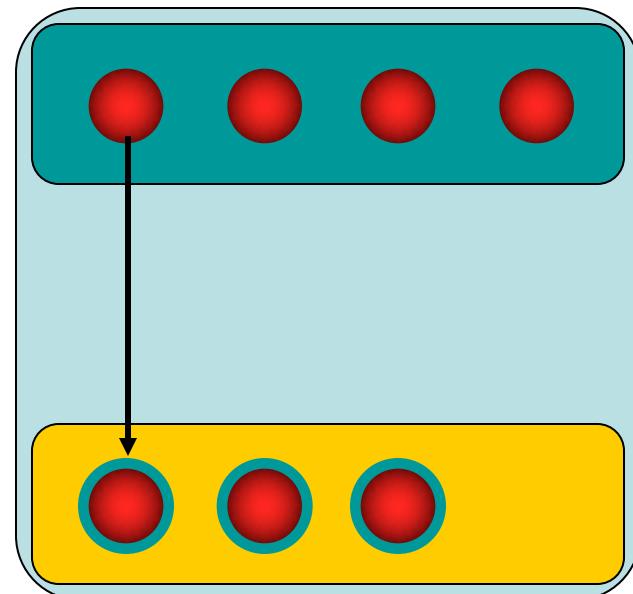

On process 0:

```
MPI_Send( buf, MPI_INT, 1, 0, tag, intercomm )
```

- Intracommunicator
- Intercommunicator

Not MPI safe if the receive
was not posted before.

Communicators - Collectives

- Simple classification by operation class
- **One-To-All** (simplex mode)
 - One process contributes to the result. All processes receive the result.
 - MPI_Bcast
 - MPI_Scatter, MPI_Scatterv
- **All-To-One** (simplex mode)
 - All processes contribute to the result. One process receives the result.
 - MPI_Gather, MPI_Gatherv
 - MPI_Reduce
- **All-To-All** (duplex mode)
 - All processes contribute to the result. All processes receive the result.
 - MPI_Allgather, MPI_Allgatherv
 - MPI_Alltoall, MPI_Alltoally
 - MPI_Allreduce, MPI_Reduce_scatter
- **Other**
 - Collective operations that do not fit into one of the above categories.
 - MPI_Scan
 - MPI_Barrier

Collectives

	Who generate the result	Who receive the result
One-to-all	One in the local group	All in the local group
All-to-one	All in the local group	One in the local group
All-to-all	All in the local group	All in the local group
Others	?	?

Extended Collectives

From each process point of view

	Who generate the result	Who receive the result
One-to-all	One in the local group	All in the remote group
All-to-one	All in the local group	One in the remote group
All-to-all	All in the local group	All in the remote group
Others	?	?

Extended Collectives

- Simplex mode (ie. rooted operations)
 - A root group
 - The root use MPI_ROOT as root process
 - All others use MPI_PROC_NULL
 - A second group
 - All use the real rank of the root in the remote group
- Duplex mode (ie. non rooted operations)
 - Data send by the process in one group is received by the process in the other group and vice-versa.

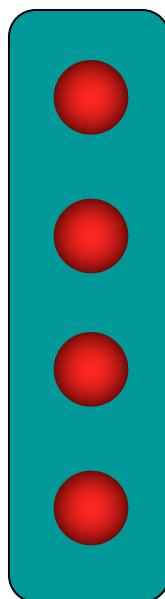

Broadcast

One-to-all

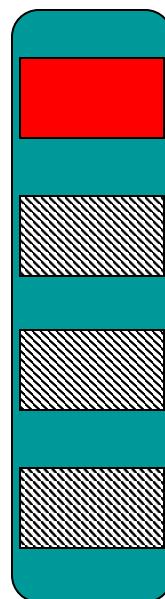

One in the
local group

All in the
local group

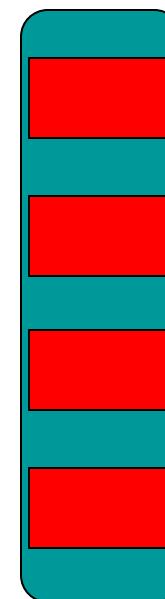

`MPI_Bcast(buf, 1, MPI_INT, 0, intracomm)`

Before

After

Extended Broadcast

One-to-all

One in the
local group

All in the
remote group

Root group root process:

`MPI_Bcast(buf, 1, MPI_INT, MPI_ROOT, intercomm)`

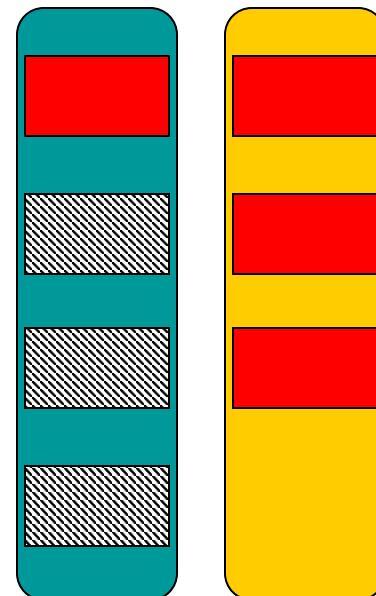

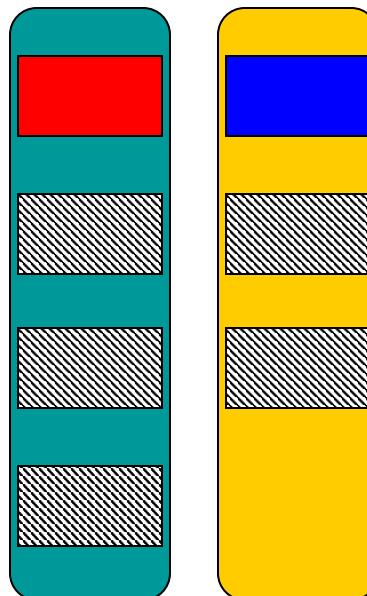

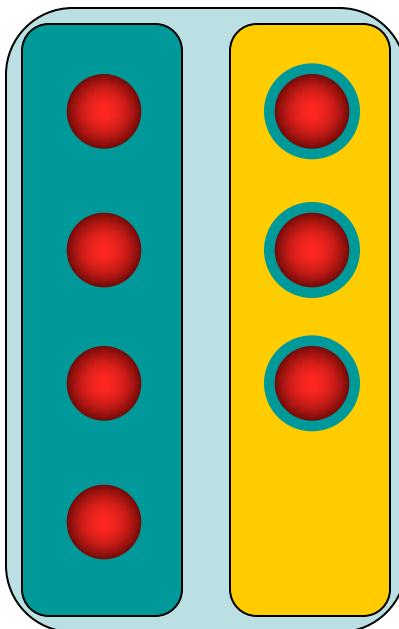

Root group other processes: `MPI_Bcast(buf, 1, MPI_INT, MPI_PROC_NULL, intercomm)`

Other group

`MPI_Bcast(buf, 1, MPI_INT, root_rank, intercomm)`

Before

After

Allreduce

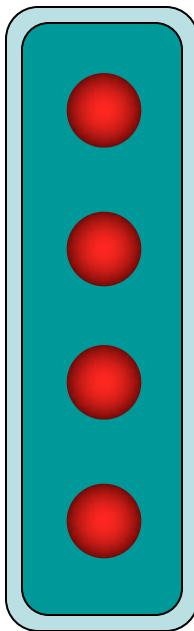

All-to-all

All in the
local group

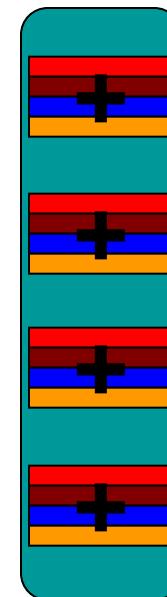

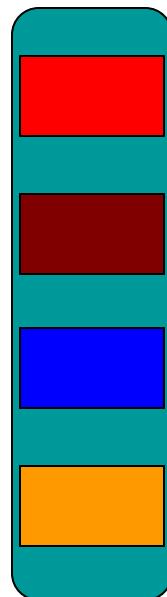

All in the
local group

`MPI_Allreduce(sbuf, rbuf, 1, MPI_INT, +, intracomm)`

Before

After

Size doesn't
matter

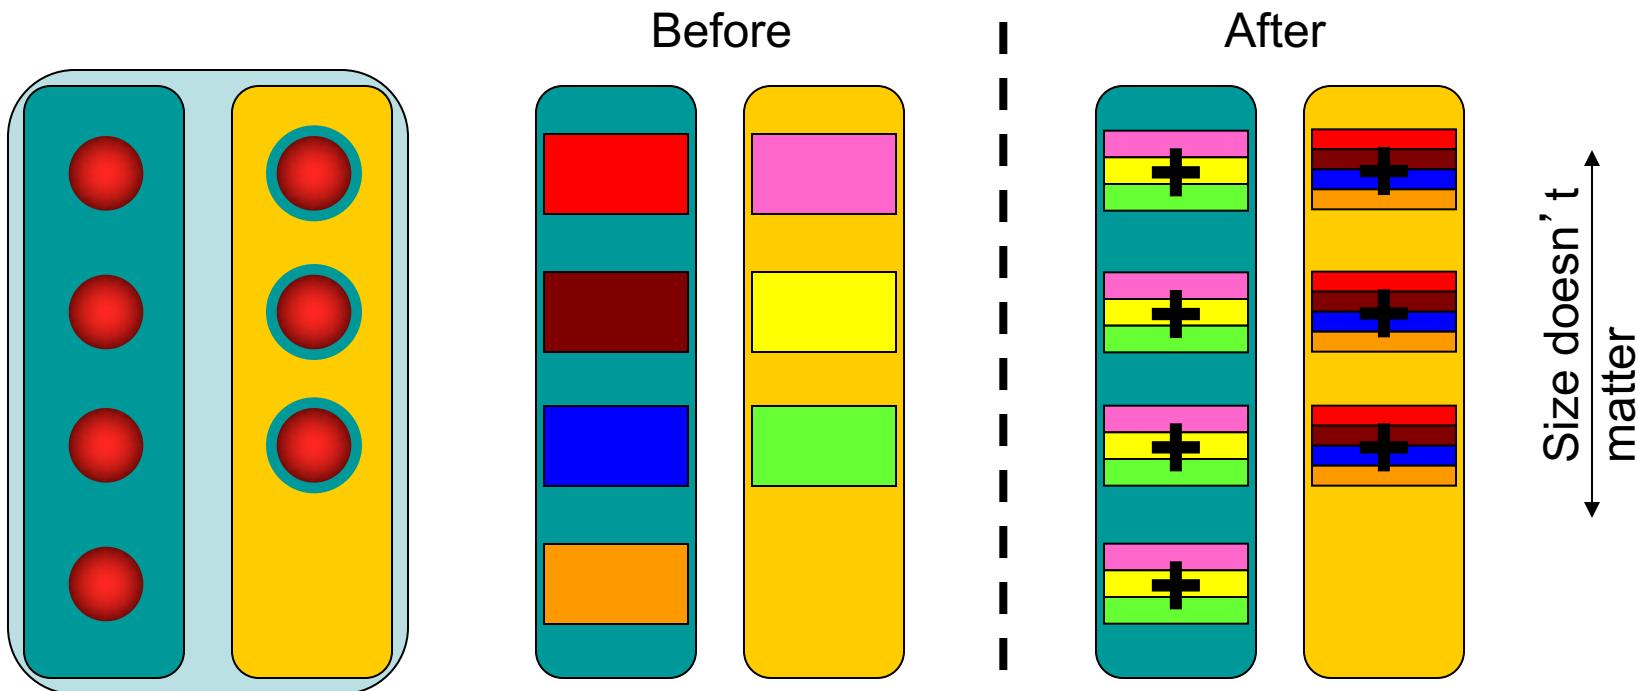

Extended Allreduce

All-to-all

All in the
local group

All in the
remote group

`MPI_Allreduce(sbuf, rbuf, 1, MPI_INT, +, intercomm)`

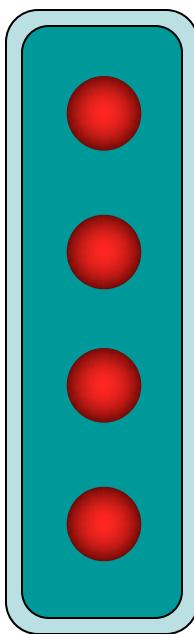

AllGather

All-to-all

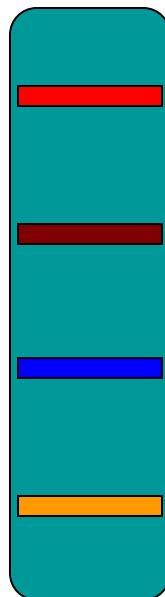

All in the
local group

All in the
local group

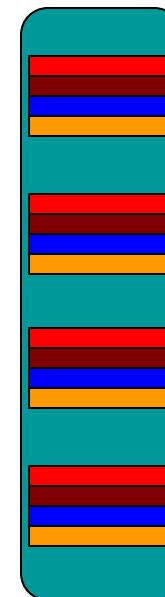

`MPI_Allgather(sbuf, 1, MPI_INT, rbuf, 1, MPI_INT, intracomm)`

Before

After

Size does
matter

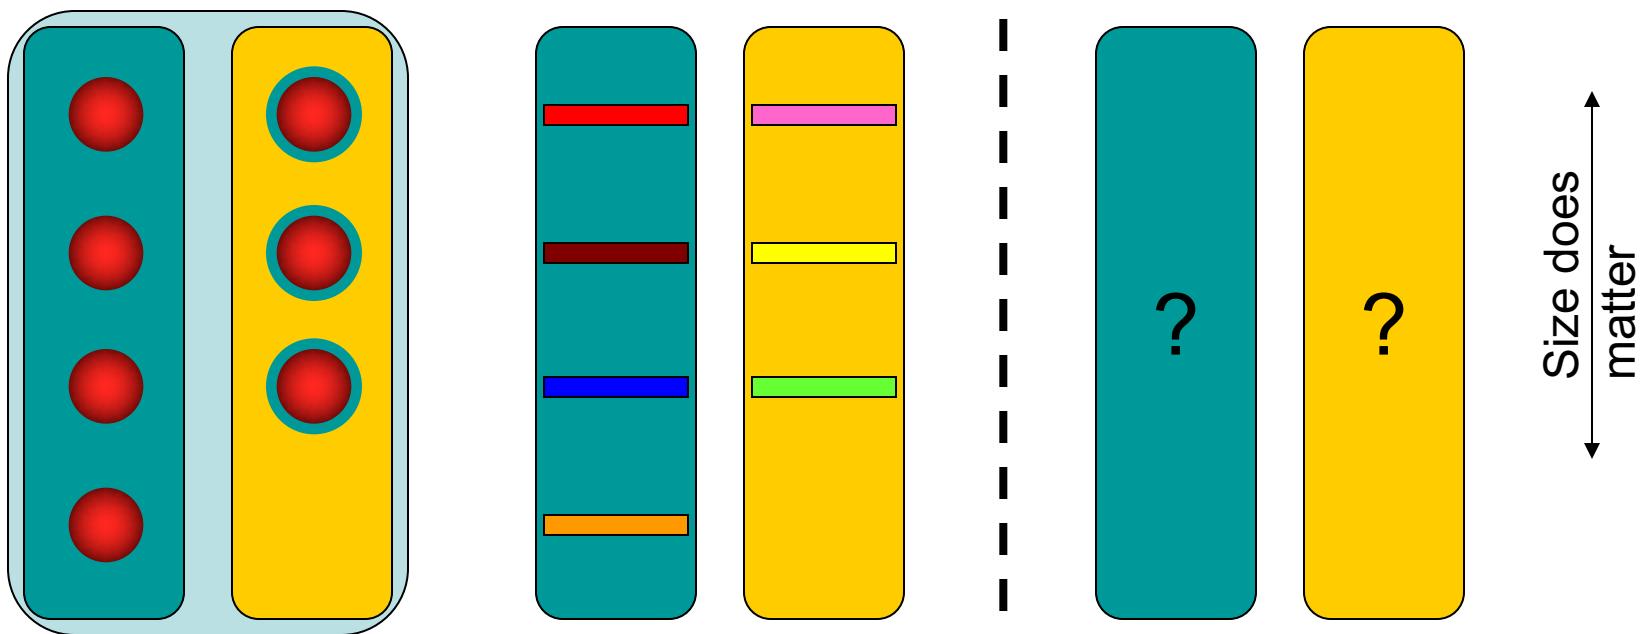

Extended AllGather

All-to-all

All in the
local group

All in the
remote group

`MPI_Allgather(sbuf, 1, MPI_INT, rbuf, 1, MPI_INT, intercomm)`

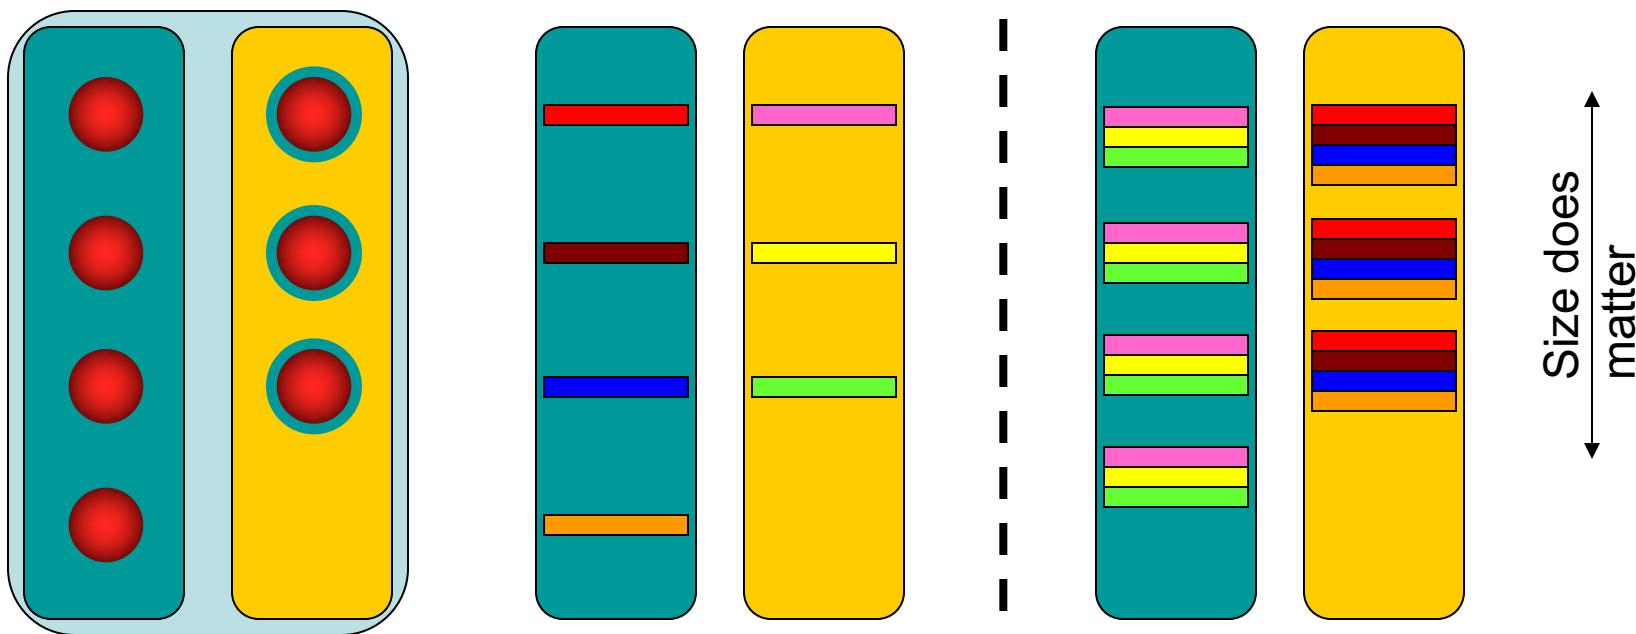

Extended AllGather

All-to-all

All in the
local group

All in the
remote group

`MPI_Allgather(sbuf, 1, MPI_INT, rbuf, 1, MPI_INT, intercomm)`

Scan/Exscan and Barrier

- Scan and Exscan are illegal on intercommunicators
- For MPI_Barrier all processes in a group may exit the barrier when all processes on the other group have entered in the barrier.
